

Nitroamine

In organic and inorganic chemistry, **nitroamines** or **nitramides** are chemical compounds with the general chemical structure $R^1R^2N-NO_2$. They consist of a nitro group ($-NO_2$) bonded to the nitrogen of an amine.^{[1][2]} The R groups can be any group, typically hydrogen (e.g., methylnitroamine $CH_3-NH-NO_2$) and organyl (e.g., diethylnitroamine $(CH_3CH_2-)_2N-NO_2$). An example of inorganic nitroamine is chloronitroamine, $Cl-NH-NO_2$.^[3] The parent inorganic compound, where both R substituents are hydrogen, is nitramide or nitroamine, H_2N-NO_2 .

Structure of the nitroamino group, $>N-NO_2$, here bonded to two R groups

N-Nitroaniline rearranges in the presence of acid to give 2-nitroaniline.^[4]
